Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score

"Primary structure of Neurospora crassa gamma-tubulin.";

Gene 199:303-309(1997).

1- FUNCTION: TUBULIN IS FOUND AT MICROTUBULE ORGANIZING CENTERS (MTOC.)

SUCH AS THE SPINDLE POLES OR THE CENTROSOME, SUGGESTING THAT IT

IS INVOLVED IN THE MINUS-END NUCLEATION OF MICROTUBULE ASSEMBLY.

1- SIMILARITY: BELONGS TO THE TUBULIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rickettsia prowazekii.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The composition can be used to affect a biological process characterized by abnormal cell migration through a physiological barrier, where the process is selected from anglogenesis, organogenesis, ovelation, inflammation, cancer, tumor cell invasion and metastasis, and atherosclerosis.
The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence complementary to a polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which comprises a by-end sequence and an oligonal polynucleotide which com
                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;
                                                                                                                                                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

The primer sets can be used in antisense therapy and in gene therapy. The primer set can be used in antisense therapy and particularly full-length cDNAs. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH18742 represent human cDNA sequences; AAB92446 to AAB9593 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                       Ubiquitin-protein ligase; Ubrl; mouse; N-end rule pathway; stress-related musc
                     The present sequence represents a ubiquitin-protein ligase called Ubr1. The Ubr1 enzymes are involved in protein ubiquitinylation and ultimate degradation through the N-end rule pathway and have been linked to stress-related muscle wasting. Recombinant Ubr1 polypeptides can be used to screen for inhibitors of muscle wasting when this is associated with the N-end rule pathway.
                                                                                                                      Disclosure;

                                                                                                                                                                                           The present sequence represents a murine Ubrl enzyme. Ubrl is an E3-type protein of the ubiquitin system. Specifically, it is a ubiquitin protein ligase. The enzyme is specific for destablising residues exposed at the N-terminus of protein substrates. Inhibition of the expression of Ubrl gene in a cell results in inhibition of the N-end rule pathway. The method is used for treatment of mammailan cells infected with an intracellular pathogen, e.g. Lysteria monocytogenes or Yersinia enterocolitica. Inhibition of N-end rule pathway is also useful for treating various diseases associated with wasting of muscle tissue and

New chimaeric genes comprise a monocotyledonous plant promoter linked to a modified nucleic acid sequence derived from the MDMV-B genome. The modification is such that mRNA is translated to a truncated protein (pref. smaller than 200 amino acids), no translation of mRNA occurs or the transcribed mRNA lacks the translation initiation codon or includes a premature stop codon. Expression of the chimaeric gene inhibits infection of plants (pref. sorghum, sugarcane, esp. malze) by MDMV. The transgenic plants display an inheritable resistance trait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 20; Page 31-44; 64pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC sequence (I) consisting essentially of one of the 93 nucleotide sequences CC given in AAH81202 to AAH81294, where expression of the nucleic acid in a CC microorganism is capable of inhibiting proliferation of a microorganism. CC (I) have antibacterial and antibiotic activities, and can be used in CC gene therapy. Expression of (I) in a microorganism inhibits proliferation CC of the microorganism, and the manufactured antibiotic is useful for CC reducing the activity or level of a gene product required for CC proliferation of a microorganism in a subject, specifically humans. The CC nucleic acids that inhibit bacterial growth or proliferation can be used CC as antisense therapeutics for killing bacteria, In addition to CC therapeutic applications, the nucleic acid sequences complementary to sequences required for proliferation can be used as diagnostic tools. CC resease that are specific for particular species of microorganisms can CC collical specimens AAH81295 to AAH81487 encode the Escherichia coli CC represent oligonucleotides, which are used in the exemplification of the

          This novel protein may be used to treat tumors of the CNS in mammal by inhibiting the overexpression of the leucine zipper protein-kinase in vivo, or by interfering with a vital signal in a chain of signals leading to tumorigenicity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC isolated from brain tissue. The specification states that the protein contains an ATP-binding site at position 537-544 (consensus CC sequence Gly-Xaa-Gly-Xaa-Xaa-Gly), a protein kinase domain at position CC 231-243 and a putative endoplasmic reticulum (ER) targeting sequence at CC position 413-418 (consensus sequence REEL). This protein is most similar CC to members of serine/threenine protein kinases and is believed to be a "mon-receptor type kinase" based on its lack of a transmembrane domain. CC probes to this protein could be used for diagnostic or research purposes CC to detect or quantitate the expression of leucine-zipper protein kinase. CC propession of leucine zipper protein kinase can result in the protein colls and metastasis. The application of exogenous cor protein roucleic acid interactions involved in hyperproliferation. This can be used to treat animals suffering from tumours of the central CC nervous system by inhibiting the overexpression of leucine-zipper protein constitutions involved in hyperproliferation. This can be used to treat animals suffering the overexpression of leucine-zipper protein constitutions involved in hyperproliferation. This can be used to treat animals suffering the overexpression of leucine-zipper protein constitutions involved in hyperproliferation of constitu
